

PGS

(Pretty Good Semantics)

Mapping Equivalent Identifiers/Locators

Review:

```
<meta scheme="pgs" name="i" value="[IRI]"/>
```

```
<meta scheme="pgs" name="r" value="[IRI]"/>
```

Where:

i = identifier

r = locator (resource)

For any IRI appearing in the document, its status as an identifier or locator is set in the header.

New:

Expand value "IRI" to be a set of IRI's separated by white space.

Semantics: The IRIs so listed are equivalent identifiers or locate the same resource.

(See "Bridging the Last Semantic Mile" for advantages.)
